OPERATOR: Coyote Mining Co., Brogan, Oregon. This company is composed of I. S. Moudy, 420 Olive Ave., Long Beach, Calif., Bert Moudy and Fred Peth.

GENERAL DESCRIPTION: The property is located on Cow Butte and consists of two full sections (1260 acres); section 31, T.14S, R. 41E and section 36, T. 14S., R. 40E., W.I. It is 14 miles West of Brogan and ½ mile North of the John Day Highway (U.S. 28).

The elevation is about 3500 feet and the topography moderately rugged. There is no timber or water on the property. Snowfall is moderate in winter.

HISTORY: Mr. J. B. White shipped two cars of antimony ore to the Selby Smelter, California, in 1908, which was said to have run 65% Sb. One car of antimony was shipped by a Mr. Long in 1917. The property was idle from 1917, until the Coyote Mining Company started work in July 1939.

GEOLOGY: The country rock is biotite diorite and schist. The contact between the diorite and schist runs N45°W through the property near the base of Cow Butte. All of the stibnite occurrences are in quartz veins in the diorite.

A four foot basalt dike striking N45°W and dipping 70-80°NE cuts the diorite. A quartz vein, varying in width from 2 to 12 inches closely follows this dike. This vein has been traced for 1000 feet by pits and trenches. The vein filling is broken and in several of the pits lenses of stibnite were found. At the time of examination no high grade antimony ore was exposed. Individual specimens however, would run as high as 50% antimony.

REMARKS: Very little development work has been done. It is possible that further work may expose enough antimony ore occurring in high grade lenses to ship a few cars. At the time of examination, no shipping ore was in sight.

INFORMANT: I. S. Moudy and HKL 10/8/40.

Hugh L. Lancaster

[Stamp: Nov 12 1940]
I visited a small antimony property, which is going under the name of Coyote Mining Company and is located on Cow Butte near the John Day highway, midway between Ironside and Brogan. They are looking for small high grade lenses. They realize that they will find no large tonnage of antimony of shipping grade. They are camped in a tent and auto trailer and are spending the minimum amount of money.

HUGH K. LANCASTER
October 9, 1940
Owner & Operator: George F. Lund and A. V. Beaver

Area: The Pacific Placer Company has about 1500 acres under lease from various land owners. Some of the land owners and their holdings are as follows:

- Murray Morton: 200 acres
- C. W. Fields: 160 acres
- Boswell: 105 acres
- Joseph Copeland: 
- Alfred Green: 20.01 acres

This ground is to be worked by the "doodle bug". There is an additional 600 acres under lease that is potential dredge ground.

Location: The Pacific Placer Co. is located on Basin Creek on the Mormon Basin-Brogan road about 10 miles from Mormon Basin. It is in T. 15 S., and R. 42 E. W.I.

History: The land under lease by the Pacific Placer Co. has been worked on a small scale by one or two men intermittently for a number of years. This is the first operation of any size or that has moved any appreciable yardage.

Development: The ground, about 400 acres, to be worked by the doodle bug has been thoroughly prospected by shafts and by drilling.

Water rights: The company has the water rights on Basin Creek. This supplies enough water to operate most of the day by using return water from the sluices.

Geology: Elevation about 4000 feet. Gentle rolling hills covered with sage brush. The bed rock is a soft clay which varies in depth from 1 to 30 feet, and averages 10 feet. The gravel is bedded and varies in size from a fraction of an inch to 10 inches. Ninety percent of the gravel is minus 4 inches. Very little clay is found in the gravel. The gravel averages 40 cents per yard.

Equipment:
- One-----20 cu. yd. Goodyear scraper
- One-----13 cu. yd. Goodyear scraper
- One-----La Taurneau ripper
- One-----65 HP Diesel Caterpillar
- One-----65 HP Diesel Caterpillar with bull dozer

The washing plant consists of a three inch hydraulic giant, a 36" x 60" symons vibrating screen with 1" openings, a 24" belt stacker, a pump to furnish water to the giant, and a 24" x 40' sluice box.
Description of Operation: The ground is loosened with the Le Tourneau ripper and loaded into a carryall scraper, which is drawn by a caterpillar. While loading, the caterpillar with the bull dozer serves as a pusher. After loading, the carryall carries its load and dumps it over an 8" grizzly into a 20 cu. yd. gravel bin. The gravel is washed from the bin by means of a 3" hydraulic plant over a 1" vibrating grizzly. The under size goes to the sluice box and over size to the stacker. Mercury is used in the sluice box.

The operation is continuous 24 hours per day, when water permits. At present there is a water shortage and the plant operates about 23 hours. About 2500 yards of gravel are washed per 24 hours.

Remarks: This company has a very efficient operation. They have prospected their ground and know what they want to do. They appear to be making money.

Informant: George F. Lund     August 29, 1940

Hugh K. Lancaster
Field Engineer
COYOTE MINE (Sb)

This report is supplement number 1 to the report by the same name in G.M.I. # 13.

Location and Ownership: As per G.M.I. # 13.

Lessee: H. D. Ramsey, Sumpter, Oregon.

Development and Geology: Several trenches and pits have been cleaned and extended by the lessee during the past year. Encouraging showings of massive stibnite have been exposed on several occasions, but these showings have never persisted for any appreciable distance. An estimated 15 to 20 tons of highgrade stibnite have been recovered, considering the amount of development work done and the lack of indications that ore might be found in greater amounts with continued digging, the results of the recent development are comparable to those reported by the Lancaster report as quoted in G.M.I. # 13.

Malheur County  

This report is supplement #2 to the report by the same name in G.M.I. #13.

Location & ownership:  As per G.M.I. #13.

General:  This property was again the object of development  
work during the year 1949 with more of the same type  
of development work as is described in supplement  
report #1. The work on this occasion was performed by  
E. E. Stauffer and associates. New bunches of  
stibnite were revealed but in insufficient amount to  
warrant even a small shipment or continued prospecting.
