INTRODUCTION

The geology of the Sparta Quadrangle, Oregon, has been described by many authors. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age.

The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age.

The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age.

The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age.

The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age.

The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age. The oldest rocks in the quadrangle are highly contorted and fractured cherts, argillites, tuffs, and conglomerates. They are probably Tertiary in age.
