Oregon Coastal Hospital Resilience Project: Resilience Planning Maps and Guidance

The 1973 Siletz River bridge on Highway 101 is seismically vulnerable. In the event of an earthquake and tsunami, the bridge will likely experience significant damage and may be impassable by vehicles for over 24 months. Bringing resources into Lincoln City by sea and by air will be necessary.

The hospital is in a high seismic hazard region and is expected to experience prolonged strong shaking. The hospital is located outside the tsunami hazard zone, so tsunami inundation is not required.
