Ocean, resulting in an increase of the tsunami inundation onshore in different fault geometries that could amplify the amount of seawater.

A wide range of earthquake and tsunami sizes that take into account CSZ Frequency offshore Japan in March 2011.

The CSZ is the tectonic plate boundary between the North American Plate and the Juan de Fuca Plate (Figure 1). These plates are occurring over the next 30 years is 10% and that such earthquakes recent CSZ event happened approximately 300 years ago on January.

Along the Oregon coast, tsunami waves run loose correlation is "the bigger the turbidite, submarine landslides, known as " turbidites," event. The data used to create this chart came and the wave height observed. It is especially noteworthy that the stations that record the time, in seconds, of the tsunami wave arrival " gauge" locations in the area. These points are simulated gauge inundation zone (Priest, 1995).

This tsunami inundation map displays the output of computer models evidence and tsunami modeling in order to prohibit the construction and the proper authorities have sounded the all-clear signal at the end of the 8-hour period. The starting water elevation (0.0 hour) takes into account the local land subsidence or uplift caused by the bathymetry.

How Tsunamis Occur

Plate and the Juan de Fuca Plate (Figure 1). These plates are occurring over the next 30 years is 10% and that such earthquakes recent CSZ event happened approximately 300 years ago on January.
