This page contains a detailed map of the Cascadia Subduction Zone (CSZ) tsunami inundation for the areas of Manzanita and Nehalem in Oregon. The map illustrates the potential extent of tsunami inundation based on historical events and earthquake scenarios.

Key elements of the map include:
- **Legend**: Shading indicates the level of tsunami inundation, ranging from light yellow to dark purple.
- **Buildings under Tsunami Inundation Zone**: Different symbols represent various types of buildings and their potential for inundation.
- **Profile Locations**: Time series graphs and wave elevation profiles showing inundation at specific locations.
- **Map Explanation**: Descriptions of the map's purpose and the data used to create it.

The map is intended to help residents and visitors in the area understand the tsunami hazard and prepare for potential events. It is based on scientific studies and simulations to establish the area of expected tsunami inundation.

**References**: Further details on the methodology and data sources are provided in the references section, which includes academic papers and reports on tsunami hazard assessment.
